

CONNECTED IN ANTIQUITY

The owner of this house, a contractor, partnered with SV Design and Ennis Construction to build a classic New England connected farmhouse with a Greek-revival home at one end and a timber-frame barn at the other. Joining the two is a metal-roofed space housing the kitchen, mudroom, and living and dining areas. The owner's passion for the antique barn frame drove the design process of marrying old and new in a tasteful way that brings wood—some salvaged and some new, some treated, and some naturally weathered—into several areas of the house, including the kitchen ceiling, kitchen island, interior sliding barn door, bathroom shelves, and fireplace mantel. Having the communal spaces echo the rustic nature of the barn fulfilled the family's desire to keep the interior finishes from feeling too dainty. Visually interesting scissor trusses engineered with reclaimed hand-hewn beams address a structural need for the vaulted ceilings, and with custom-fabricated steel through-bolts, they also reinforce the rugged aesthetic. For durability, the beams are oak, as are the floors, where circular sawmill marks add to the aesthetic. The whitewashed kitchen ceiling and old reclaimed boards offer a variety of contrasting textures and tones. Leftover wood was put to good use in the basement to create ski racks and wrap lally columns.
